The present invention describes a compound (1) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, a 'UTR or introp'region of a nucleic acid molecule encoding phospholipase A2, group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (1) a composition comprising the compound and carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal straing a disease or condition associated with phospholipase A2, group IIA (synovial). (1) has antinflammatory, antidabetic, cytostatic and antipsoriatic activities, and can be used in vaccines and in gene therapy. The compound (1) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial). (2) the compound (1) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) contact the present sequence represents a human phospholipase A2 group IIA (synovial) contact is present sequence the present in an antipense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phospholipase A2 group IIA; synovial; antisense modulation; inflammation; phospholipase A2 group IIA inhibitor; phosphorothicate; antiinflammatory; antidiabetic; cytostatic; antipsoriatic; vaccine; gene therapy; cancer;

The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, 2' UTR or intron region of a nucleic acid molecule encoding phospholipase A2, group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (1) a composition comprising the compound and a carrier of diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (I) has antinflammatory, antidiabetic, cytostatic and antipporiatic activities, and can be used in vaccines and in gene therapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) composition to the present sequence represents a human phospholipase A2 group IIA (synovial) composition to the present sequence represents a human phospholipase A2 group IIA (synovial)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phospholipase A2 group IIA; synovial; antisense modulation; inflammation; phospholipase A2 group IIA inhibitor; phosphorothioate; antiinflammatory; antidiabetic; cytostatic; antipsoriatic; vaccine; gene therapy; cancer; psoriasis; diabetes; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                             New compound that hybridizes with and inhibits the expression of Phospholipase A2, group IIA, useful for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human phospholipase A2 antisense oligonucleotide SEQ ID NO:19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and antipsoriatic activities, and can be used in vaccines and in gene therapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) chimeric phosphorothloate, antisense oligonucleotide, which is used in an

The present invention describes a compound (I) comprising 8-50
nucleobases which is targeted to a 5' untranslated region (UTR), coding,
3' UTR or intron region of a nucleic acid molecule encoding phospholipase
A2, group IIA (synovial), where the compound specifically hybridises with
and inhibits the expression of phospholipase A2, group IIA (synovial).
Also described: (1) a composition comprising the compound and a carrier
or diluent; (2) a method of inhibiting the expression of phospholipase
A2, group IIA in cells or tissues, and (3) a method of treating an animal
having a disease or condition associated with phospholipase A2, group IIA
(synovial). (1) has antiinflammatory, antidiabetic, cytostatic and
antipsoriatic activities, and can be used in vaccines and in gene
therapy. The compound (I) can be used for preparing a composition for
treating or preventing inflammation, cancer, psoriaals or diabetes. The
present sequence represents a human phospholipase A2 group IIA (synovial)
chimmeric phosphorothioate antisense oligonucleotide, which is used in an
example from the present invention
                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SXXXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                   The present invention describes a compound (I) comprising 8-50
nucleobases which is targeted to a 5' untranslated region (UTR), coding,
and include the expression of a nucleic acid molecule encoding phospholipase
A2, group IIA (synovial), where the compound specifically hybridises with
and inhibits the expression of phospholipase A2, group IIA (synovial).
Also described: (1) a composition comprising the compound and a carrier
or diluent; (2) a method of inhibiting the expression of phospholipase
A2, group IIA in cells or tissues; and (3) a method of treating an animal
adjaces or condition associated with phospholipase A2, group IIA
(synovial). (I) has antiinflammatory, antidiabetic, cytosteric and
antipsoriatic activities, and can be used in vaccines and in gene
therapy. The compound (I) can be used for preparing a composition for
treating or preventing inflammation, cancer, postasis or diabetes. The
present sequence represents a human phospholipase A2 group IIA (synovial)
chimeric phosphorothioate antisense oligonucleotide, which is used in an
example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phospholipase A2 group IIA; synovial; antisense modulation; inflammation; phospholipase A2 group IIA inhibitor; phosphorothioate; antiinflammatcry; antidiabetic; cytostatic; antipsoriatic; vaccine; gene therapy; cancer; psoriasis; diabetes; ss.

The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, 3' UTR or intron region of a nucleic acid molecule encoding phospholipase A2, group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (1) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (1) has antinflammatory, antidiabetic, cytostatic and antipsorlatic activities, and can be used in vaccines and in gene therapy. The compound (1) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial). Chimeric phosphorchioate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phospholipase A2 group IIA; synovial; antisense modulation; inflammation; phospholipase A2 group IIA inhibitor; phosphorothioate; antiinflammatory; antidiabetic; cytostatic; antipsoriatic; vaccine; gene therapy; cancer; psoriasis; diabetes; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound that hybridizes with and inhibits the expression of Phospholipase A2, group IIA, useful for preparing a composition for treating or preventing inflammation, cancer, psorlasis or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human phospholipase A2 antisense oligonucleotide SRQ ID NO:20.

                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, 3' UTR or intron region of a nucleic acid molecule encoding phospholipase C 3' UTR or intron region of a nucleic acid molecule encoding phospholipase C and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (1) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (I) has antiinfilammatory, antidiabetic, cytostatic and can be used in vaccines and in gene therapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriaats or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) chimeric phosphorothioate antisense oligonucleotide, which is used in an example from the present invention

The present invention relates to a novel pharmaceutical composition

comprising: (a) an agent capable of modulating an expression level or

protein activity of a cancer-related transmembrane protein (CRTP) or gene

an antibody specific for a CRTP, or a T cell activated by a CRTP; and

(b) a carrier. The pharmaceutical composition may also comprise a

colymucleotide capable of inhibiting or decreasing the expression of the

CRTP by RNA interference or an antisense mechanism. The CRTPs of the

chromotion are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3,

convertion are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3,

convertion are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3,

convertion are selected from a useful for treating cancer, e.g. colon

cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney

cancer, stomach cancer, and esophageal cancer. The present sequence is a

CRTP short interfering RNAS (siRNA) oligonucleotide. Note: The sequence

data for this patent did not form part of the printed specification, but

was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                          The present invention relates to a novel pharmaceutical composition

comprising: (a) an agent capable of modulating an expression level or

protein activity of a cancer-related transmembrane protein (GRTP) or gene
; an antibody specific for a CRTP, or a T cell activated by a CRTP; and

(b) a carrier. The pharmaceutical composition may also comprise a
polynucleotide capable of inhibiting or decreasing the expression of the

CRTP by RNA interference or an antiseane mechanism. The CRTPs of the
invention are selected from ABC4, C20orf103, CACNAID, CDH6, CST, ENPP3,

FLJ1856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The
pharmaceutical composition is useful for treating cancer, e.g. colon
cancer, stomach cancer, breast cancer, prostate cancer, liver cancer, kidney
cancer, stomach cancer, not esophageal cancer. The present sequence is a
target oligonucleotide from one such CRTP for which short interfering
CRNAB (aiRNA) were produced. Note: The sequence data for this patent did
not form part of the printed specification, but was obtained in
electronic format directly from WIPO at

The present invention relates to a novel pharmaceutical composition
comprising: (a) an agent capable of modulating an expression level or
protein activity of a cancer-related transmembrane protein (GRTP) or gene
an antibody specific for a CRTP, or a T cell activated by a CRTP; and
(b) a carrier. The pharmaceutical composition may also comprise a
polymucleotide capable of inhibiting or decreasing the expression of the
CRTP by RNA interference or an antisense mechanism. The CRTPs of the
invention are selected from ABC4, C20orfio3, CACNAID, CDH6, CST, ENPP3,
FLJ1856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The
pharmaceutical composition is useful for treating cancer, liver cancer, kidney
cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney
cancer, stomach cancer, and esophageal cancer. The present sequence is a
target oligonucleotide from one such CRTP for which short interfering
CRNAB (SIRNA) were produced. Note: The sequence data for this patent did
not form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition comprising an agent capable of modulating an expression level or protein activity of a gene, e.g. ABCC4, or a T cell activated by the polypeptide or antibody, and a carrier, useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 14
```

```
The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein dethvity of a cancer-related transmembrane protein (CRTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polymucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABC4, C20orf103, CACNAID, CDH6, CST, ENPP3, FLJ11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, kidney cancer, stomach cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, prostate cancer. The present sequence is a CRTP short interfering RNA (siRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition comprising an agent capable of modulating an expression level or protein activity of a gene, e.g. ABCC4, or a T cell activated by the polypeptide or antibody, and a carrier, useful for

The present invention relates to a novel pharmaceutical composition

comprising: (a) an agent capable of modulating an expression level or

protein activity of a cancer-related transmembrane protein (CRTP) or gene
; an antibody specific for a CRTP, or a T cell activated by a CRTP; and

(b) a carrier. The pharmaceutical composition may also comprise a

polynucleotide capable of inhibiting or decreasing the expression of the

CRTP by RNA interference or an antisense mechanism. The CRTPS of the

creation are selected from ABCC4, C20orfulo3, CACNALD, CDR6, CST, ENPP3,

FLJ1856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The

cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney

cancer, lung cancer, and scophageal cancer. The present sequence is a

target oligonucleotide from one such CRTP for which short interfering

target oligonucleotide from one such CRTP for which short interfering

target climate directly from WIPO at

celectronic format directly from WIPO at

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (GFTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polynucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orfil03, CACNAID, CDH6, CST, ENPP3, FLJ11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The

The present invention relates to a novel pharmaceutical composition comportsing: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (RTP) or gene; an antibody specific for a GTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polymucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3, CPLAI1856, GPR54, HAVCH1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, e.g. colon cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a cancer, interfering RNAs GIRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (CRTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polynucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3, CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3, CTL1856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, e.g. cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a cancer interfering RNBs (siRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition comprising an agent capable of modulating expression level or protein activity of a gene, e.g. ABCC4, or a T ce activated by the polypeptide or antibody, and a carrier, useful for

The sequences given in AAT48821-34 are primers which were used to amplify regions of the type II non-pancreatic phospholipase A2 (PLA2s) gene at which mutations occur. These primers amplify regions upstream of the first exon and exon one, around the microsatellite, and exons 2, 3, 4 and 5 and the surrounding sequences. These primers may be used in the method of the invention for identifying an individual at an elevated risk of colon cancer. The method comprises: (a) isolating genetic material from a tissue or body fluid sample from the individual; and (b) detecting a plaze gene mutation which is indicative of the individual is at an elevated risk of colon cancer; or (b') detecting the absence of PLA2s protein or PLA2s enzyme activity in an isolated protein sample which is indicative of the individual having an elevated risk of colon cancer. The method allows individual having an elevated risk of colon cancer. The mutation to be identified. In the treatment of colon cancer, the patient is administered a recombinant vector incorporated within a non-toxic

Identifying animal genetic marker that influences trait for determining parentage or to infer breed/line in e.g. canines involves analyzing markers of genome-wide genetic marker map for association with genetic

Claim 44; SEQ ID NO 181; 145pp; English.

trait.

The invention relates to a method of identifying a companion animal companion arimal genetic marker that infiltences a phenotype or trait comprising analyzing companion animal genetic marker that infiltences the trait. Also described are: (1) a high companion animal genetic marker that infiltences the trait. Also described are: (1) a high companion animal system for setting the motion of a secociation animal system for determining the nucleotide accorrances at a series of companion animal system for setting system for determining the nucleotide accorrance of a series of companion animal system, and described are: (1) a high manner of companion animal system for setting system for determining the nucleotide contracts of companion animal system, and system for applying a liquid to the series of oligonucleotide to a polymucleotide sociation of sectises of companion animal system, and system for applying a liquid to the series of oligonucleotide to a polymucleotide sociation of sectises of companion animal system, and oligonucleotide to a polymucleotide sociation of sectises of companion animal system, and oligonucleotide occurrence of the system of oligonucleotide occurrence of the system of oligonucleotide probe and/or primaryprimary system of the most 3 position of mucleotide occurrence of a least one canne system of incleotide occurrence of a series of complement in the most 3 position of mucleotide occurrence of a least one system of complement in the most 3 position of mucleotide sociations of a complement in the most 3 position of mucleotide sociations and animal system of the s

cc second primer selected from SEQ ID Nos 204-305 in the method of the invention. The method is useful for identifying a companion animal companion. The method is useful for identifying a companion animal comparation are to infer breed/line of a canine test subject, for identifying/inferring a genetic trait (preferably resistant to disease or infection), susceptibility to infection, regulation of immune status and response to antigens, previous exposure to infection or parasites, captibility to infection, the conformance status and response to antigens, previous exposure to infection or parasites, companion animal (preferably doss, cats, fish, reptiles, brids, horses, autoimmune disorders, kidney disease and neurological disease in companion animal (preferably doss, cats, fish, reptiles, birds, horses, captiles, hamsters, garbils, mice or rats, especially dos). The methods/eystems help for managing, selecting and breeding companion animals, maximizing individual potential performance and health, allowing predictive (predisposition) diagnostics, nutritional theraples and collect, record and store data by individual animal identification so that it is usable to improve future animals as applied to companion animals, companion animal, to animal to manage, sort, traits such as energy metabolism, aging and breed-specific traits to companion animal, to and improve the genetics of a companion animal, to an energy metabolism, aging and breed-specific taits of an dimprove the genetics of a companion animal, to manage, sort, and improve the genetics of a companion animal or offspring, and to diagnose a health condition of a companion animal or offspring, and to diagnose a health condition of a companion animal or offspring, and to diagnose correct trait, to track a companion animal or offspring, and to diagnose a health condition of a companion summal. This sequence represents a per expresents a per correction of canine some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition comprising an agent capable of modulating an expression level or protein activity of a gene, e.g. ABCC4, or a T cell activated by the polypeptide or antibody, and a carrier, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; Gene therapy; Vaccine; RNA Interference; cancer; 88; short interfering RNA; gene silencing.

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (GRTP) or gene; an antibody specific for a GRTP, or a T cell activated by a CRTP; and (D) a carrier. The pharmaceutical composition may also comprise a cRTP; and cRTP by RNA interference or an antibense mechanism. The expression of the cRTP by RNA interference or an antibense mechanism. The CRTPs of the invention are selected from ABC4, C20orfi03, CACNAID, CDH6, CST, ENPP3, FLJ11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, e.g. colon cancer, stomach cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a CRTP short interfering RNA (siRNA) oligonucleotide. Note: The sequence cate for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The present invention relates to an antisense compound targeted to a mucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to disher path pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mid-to-moderate puin from burns, migraine headache, cluster headache, mid-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclectife with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                          Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; 8s.
                                                                                                  Chimeric phosphorothioate oligonucleotide to target Navl.3 #208.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 4; SEQ ID NO 208; 417pp; English

The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, triggminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonuclectide with 2 MOB wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonuclectides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in mittinell plates numbered for discrimination are mixed in each of the multiwell plates to be primer designed based on the chromosome marker multiwell plates; (b) a primer designed based on the chromosome marker compared to corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order compared to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell compared in the multiwell plates of the specified and lateral directions; (f) the mixed clones are cultured and the cresultant cultures are maxed respectively in each wells of longitudinal consultant cultures are amplified by using the above primer; (g) signals and detected from the amplified by using the above primer; (g) signals reconstituted as the positions on the chromosome and arrayed. The cremestive sequence for human chromosome alones are present compared for human chromosome 21q22.1, which are separed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to proteins, polypeptides and nucleotides related to the human homologue of the Drosophila suppressor of fused gene, which is involved in the transduction of signals in the human hedgehog-patched (HH-PTC) pathway. Protein molecule capable of eliciting an intracellular signal in the HH-PTC pathway, its antibodies and pharmaceutical compositions comprising them can be used as medicaments for the treatment and/or prevention of split hand/split foot malformation type 3 (SHRM3). The polymucleotides and polypeptides of the invention can be used to gain an understanding of a signalling pathway that is central to normal development and often disrupted in disease. This knowledge will be value for therapeutic strategies involving modification of sonic hedgehog-tissue/wound healing, neurodegenerative diseases, testicular function and cancer. The polymucleotides of the invention may also be used in gene therapy methods. The present sequence is a rapid amplification of CDNA ends (RACE) PCR primer used for cloning human SU(FU) homologue. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic, neuroprotective, suppressor of fused; SUFU; signal transduction; patched receptor; hedgehog ligand; hedgehog-patched pathyway; HH-PTC pathway; Split hand/Split foot Malformation Type 3; SHFM3; sonic hedgehog-patched; SHH-PTC signal pathway; tissue healing; wound healing; energenerative disease; testicular function; cancer; gene therapy; human; SUFUH; PCR; primer; 88.

The invention describes novel human homologues to molecules associated with the Drosophila suppressor of fused (SUFU) gene. These molecules are with the Drosophila suppressor of fused (SUFU) gene. These molecules are interaction between the patched receptor and any one of the hedgehog control of the human hedgehog patched (HH-PPC) pathway and intracellular signal in the human hedgehog-patched (HH-PPC) pathway and exhibiting a substantial similarity (sepecially about 80%), the amino acid sequence is not given in the specification; an isolated human DNA sequence (II) capable of involvement in eliciting an intracellular signal in the HH-PPC pathway, the nuclectide sequence (3); thracellular signal in the HH-PPC pathway, the nuclectide sequence (3); and cyression cassette comprising (II) or the DNA sequence (3); a cell comprising the expression cassette of (5); an antibody that binds (1) or their variants, a vector comprising (II) or the DNA sequence (3); a cell comprising the expression cassette of (5); an antibody that binds (1); a recombinant cell expressing that binds (2); a recombinant cell expressing the antibody of (7); a kit for the detection of a human suppressor of fused gene, comprising a nucleic acid sequence capable of hybridising specifically with (II); and and some capable of hybridising specifically with (II); and nucleic acid sequence capable of hybridising specifically with (II); and and split for Malformation Type 3 (SHFM3). The polymucleotides and polympetides can be used to gain an understanding of a signaling pathway companies and pharmaceutical compositions comprising a modification of sonic hedgehog-patched (SHH-PTC) signaling pathway. The knowledge will be value for therapatch extractive diseases, testicular function and cancer. The polymucleotide may also be used in gene therapy methods. This sequence represents a primer used to isolate the sequence represents a primer used to isolate the sequence of fused (SUFWH).

This invention relates to a novel isolated Animan profesh Kinase, WCKKC.

This invention relates to a novel isolated Animan profesh Kinase, with sequence shows homology to rat myotconic dystrophy kinase-related cod-12 binding kinase 2 (WECK2). The gene encoding the novel kinase is localised to human in locus 142 of human chromesome. The novel protein will be profesh may functional/structural domains that include a kinase domain, a pichein may function as a downstream effector of Cdc42 in command. The invention may be useful for the production of cytostatic, antinflammatory, antiarteriosclerotic, ophthalmological, antipsoriatic, antishfammatory, antiarteriosclerotic, ophthalmological, antipsoriatic, antishfumatic, antiarteriosclerotic, or antirheumatic, antipsoriated, antiaschmatic, antiartheumatic, antiartheumatic, antiartheumatic, cantingsoriated, antiartheumatic, and any perventing or treating an myotonic dystrophy kinase-related cdc42 binding kinase 2 (WECK2) -Inhibitors or MRCK2-Modulator. In subject such as inflammation, cancer, arteriosclerosis, psoriasis, as subject such as inflammation, cancer, arteriosclerosis, psoriasis, cardiovascular disorders, autoimume disorders, retinal detachment, stroke, epilepsy, isobaematic, fraperfusion, brasst cancer, our-anditions, cancer, brain cancer, Kaposis, grarcoma, pancer, brain cancer, Kaposis, sarcoma, pancer, and other tumours. The MRCK2 and MRCK2 gene are useful as models (for the development of human therapeutic targets, and in the calculation of therapeutic proteins, and serve as targets for the identification of therapeutic proteins. The MRCK2 and MRCK2 gene

```
The present invention relates to a novel pharmaceutical composition

comprising: (a) an agent capable of modulating an expression level or

protein activity of a cancer-related transmembrane protein (GRPP) or gene

an antibody specific for a CRPP, or a T cell activated by a CRTP; and

(b) a carrier. The pharmaceutical composition may also comprise a

polymucleotide capable of inhibiting or decreasing the expression of the

CRTP by RNA interference or an antisense mechanism. The CRTPs of the

invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3,

PLAIDS6, GRRF4, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The

pharmaceutical composition is useful for treating cancer, e.g. colon

cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney

cancer, stomach cancer, and esophageal cancer. The present sequence is a

CRTP short interfering RNAS (SIRNA) oligomucleotide. Note: The sequence

data for this patent did not form part of the printed specification, but

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify concleid acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 provided initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP-1 may be used for diagnosing a charageutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pct_sequence

The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule appures for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

ö
polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived

                                                                                                                                                                                                           ö
                                                      (S1) of myosin-like protein-1 (hoDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 958 deviation from (S1) which are conservative substitutions, and 658 identity to (S1). A polypeptide of the invention acts as a sgonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
myosin-like protein-1 such as disorder of heart and/or skeletal muscle

The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a tragment of at least 8 amino acids fully (SI), 95% deviation from (SI) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of HGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                             Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  G-alpha-13; human; inhibitor; cancer; antisense compound; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound appecifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2 MOB wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target
is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha -13, such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compound targeted to a nucleic acid molecule encoding bava.13, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, lower back pain, pean from burns, migraine headache, cluster headache, mild-to-moderate bain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2.7ME wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                           Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. neathous cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIVAIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify chgMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypuc improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomclecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in parients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production used the apprecase in disorders associated with the expression of hGDMLP-1, in particular heart of all sorders associated with the expression of hGDMLP-1, in particular heart can associated with the expression of the present invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically and/or and/or amount specifically proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as theraputic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed content of the present invention. N. B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat figure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                          Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                       Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:10024.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shannon ME:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chen W,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hanzel DK, Rank DR,

The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 molypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing an medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or preventing a disorder associated with
                                                                                                                                               φ
                                                                                      ä
The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (MDDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (SI), 95% deviation from (SI) which are conservative substitutions, and 65% identity to (SI). A polypeptide of the invention acts as a agonist antagonist of hODMLP-1, or as an inhibitor of hODMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGP-R) is activated in an autocrime manner, inhibits the growth of these cells. The isolated in peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Rap-Gh-Glu-Glu-Lys (P2) Lys-Lew-Met-Ser-Tyr (P3) Phe-Phe-Phe-His-Pro-Val (P5) (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, percessarcoma, malanoma, machoma, neuroblastcoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (anglogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.
                                                                                                                                                                                                                                                   ö
diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders.
                                                                                                                                                                                                                                                   Gaps

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates to hGDMLP-1 protein variants abstrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP capture probes for surface-enhanced laser described in ionisation and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a

ö disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; isolated nucleic acid, useful for treating viral diseases associated a tumors and cell degeneration, also related polypeptides, antibodies Gaps ö Tumour suppression related human fukutin oligo SEQ ID No 3657. antisense; sense; tumour; cell degeneration; cancer; Alzheimer schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds. The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with medicament for treating or preventing a disorder associated with antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ø
diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, e.g. polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELPI). The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELPI. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ๙
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the conclectides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour cupression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by developmental.

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          es; probe; myosin-like protein-1; hGDMLP-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistence to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful seprobes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant playmanceuticals for prevention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel isolated nucleic acid sequences involved

                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                              The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the

Four oligonucleotide probes (AAQS5741-44) and two oligonucleotide templates (AAQS5739-40) were used in a ligase chain reaction of seconbinant bfu DNA ligase. The assey shows that both Tth DNA ligase and Pfu DNA ligase perform well in LCR after multiple cycles forming a single LCR DNA fragment without appreciable blunt-end ligation or background exaction prods. However, the Tth DNA ligase in not heat stable when exposed to temps. required to separate the strands of double-stranded genomic DNA. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Four oligomucleotide probes (AAQ55741-44) and two oligomucleotide templates (AAQ55739-40) were used in a ligase chain reaction of recombinant Pfu DNA ligase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant Pyrococcus furiosus (Pfu) DNA ligase (AAR96967) activity was assayed in a ligase chain reaction (LCR). The DNA templates consist of two complementary 36-mer synthetic oligonucleotides (AA714931). The probes consist of 18-mer oligonucleotides (see AA714934-37). The results illustrated that both Tth and Pfu DNA ligase perform will in LCR after multiple cycles forming a single LCR DNA fragment without appreciable blunt-end ligation or background reaction products. Pfu DNA ligase was able to perform well in LCR without a "pro-melting" step, whereas Tth DNA ligase produced no detectable LCR product indicating that the Tth DNA ligase is not heat stable when exposed to temperatures required to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Plasmid contg. gene for thermostable DNA ligase - useful in ligase chain reactions, stable up to 100 deg. C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        separate the strands of double-stranded genomic DNA. (Updated on 25-WAR-2003 to correct PF field.)
LCR DNA fragment without appreciable blunt-end ligation or background reaction prods. However, the Tth DNA ligase in not heat stable when exposed to temps. required to separate the strands of double-stranded genomic DNA. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                Gaps

Recombinant Pyrococcus furiosus (Pfu) DNA ligase (AAR96967) activity was assayed in a ligase chain reaction (LCR). The DNA templates consist of two complementary 36-mer synthetic oligonucleotides (AAT14931). The probes consist of 18-mer oligonucleotides (ReAT14931). The results illustrated that both Tth and Pfu DNA figase perform will in LCR after multiple cycles forming a single LCR DNA fragment without appreciable blunt-end ligation or background reaction products. Pfu DNA ligase was able to perform well in LCR without a "pre-melting" step, whereas Tth DNA ligase produced no detectable LCR product indicating that the Tth DNA ligase is not heat stable when exposed to temperatures required to separate the strands of double-stranded genomic DNA. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                          Plasmid contg. gene for thermostable DNA ligase - useful in ligase chain reactions, stable up to 100 deg.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                  corresponding nucleotides and the protease domain of a type-II membrane-
type serine protease (MTSP). MTSP is useful for identifying compounds
type serine protease (MTSP). MTSP is useful for identifying compounds
medicament for treating neoplastic disease. MTSP and its corresponding
nucleotides are useful in preventing or treating tumours or cancers such
as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in
diagnostics and in hybridisation assays. MTSP is useful as a diagnostic
marker for tumour development, growth and/or progression and as
immunogens to generate antibodies that specifically bind to it. MTSP DNA
is useful in a yeast two-hybrid system and in gene therapy. The present
sequence is a gene-specific RACB (rapid amplification of cDNA ends) PCR
primer used to obtain 5' region of cDNA encoding protease domain of MTSP1
                                                                                                                                                                                                                                                                                                  Novel single chain polypeptide comprising protease domain of type-II membrane-type serine protease or its catalytically active portion useful for treating and preventing cancer and tumor.

Matriptase and MTSP1 are serine proteases reported to be expressed in high levels in certain cancer cell lines. The compounds of the invention are useful for treating conditions ameliorated by inhibition of the serine protease activity of matriptase or MTSP1. The compounds are also useful in the prevention and treatment of cancerous conditions and decrease the growth of cancerous tumours and retard metastasis. The present sequence is a PCR primer used for amplifying human MTSP1 protease domain cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               BB; Serine protease; matriptase; MTSP1; cancer; tumour; colon cancer; lung cancer; stomach cancer; rectal cancer; skin cancer; human; protease domain; PCR; primer.

The invention relates to a method of treating a condition ameliorated by an inhibition or decrease in serine protease activity of matriptase or MTSP1 which comprises administration of a peptide containing compound. The compound is useful for treating pathological conditions ameliorated by decreasing or inhibiting serine protease activity of matriptase or MTSP1, for the treatment of cancerous conditions, e.g. cancerous tumours, colon cancer, lung cancer, stomach accer, rectal cancer or skin cancer. The present sequence represents the human MTSP1 sense PCR primer.
Treatment of condition ameliorated by inhibition of serine protease activity of matriptase, e.g. cancerous tumors, retard metastasis or cancer of lung, colon and stomach, comprises administration of a peptide

infection

The invention relates to a novel isolated or purified nucleic acid. A polypeptide encoded by a nucleic acid of the invention has antibacterial activity, and may have a use in a vaccine. The nucleic acid is a TbD1 nucleic acid having a fully defined sequence of 3953 bp given in the specification. The TbD1 deletion or mmpL6 551 polymorphism is useful as a genetic marker for the differentiation of Mycobacterium strain of M. tuberculosis complex. The genetic marker in association with at least one genetic markers selected from RD1, RD2, RD3, RD4, RD5, RD6, RD7, RD8, RD9, RD10, Rd11, RD13, RD14, RVD1, RVD3, RVD4, RVD5, RD6, RD7, RD8, SyrA95, oxyR'285, and pncA57, may be used for the differentiation of Mycobacterium strain of M. tuberculosis complex. The nucleic acids may

also be used to distinguish an infection resulting from M. tuberculosis from an infection resulting from M. africanum, M. canetti, M. microti, M. bovis, M. bovis BCG. The present sequence is used in the exemplification of the invention. 8888888

New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders.

Disclosure; SEQ ID NO 177; 48pp; English.

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGF-R) is activated in an autocrine manner, inhibits the growt not plot. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys (P1) App-AspGlu-Glu-Lys (P2) Lys-Luwet-Ser-Tyr (P3) Phe-Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cellys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cellysarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (anglogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGPMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel myosin-like protein-1, useful for treating or preventing disorder

                                                                                                    The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 55% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a facilitative glucose transporter protein, GLUT9, and its functional fragments. Agents that inhibit activity or expression of GLUT8 (particularly non-utilizable glucose analogues, antisense sequences or dominant negative mutants) are used to treat malignancy, particularly cancer of breast, prostate and epithelial cells (e.g. skin or colon). Agents that upregulate expression of GLUT8 (e.g. the GLUT8 gene, administered by tissue-localized gene therapy) are used to treat non-insulin-dependent diabetes mellitus and/or insulin
genome-derived
associated with decreased expression or activity of human genome-derive myosin-like protein-1 such as disorder of heart and/or skeletal muscle

The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement thorapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide
resistance (e.g. central obesity, hypertension, dyslypidaemia or glucose intolerance). Detecting expression of GLUT8 is used for diagnosis, monitoring and staging of cancers, particularly of the breast. Antibodies raised against GLUT8 are useful as immunoassay reagents and as therapeutic inhibitors. PCR primers AAX35521-22 were used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human
                                                                                                                                                                                                            Gapa

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis

The present sequence was used to isolate a cDNA fragment of the chick seven transmembrane receptor R35 by RNA fingerprinting. R35 is useful for treating neuropathic pain, inflammatory and chronic pain, incontinence, and disorders of the gastrointestinal tract associated with gut motility and secretion such as irritable bowel syndrome. It is also useful for inducing an immune response in a mammal to protect against the diseases. It is useful in screening assays to identify compounds which stimulate or inhibit the function of the polypeptide, to identify membrane bound or solubbe receptors and also for the structure-based design of an agonist, antagonist or inhibitor of R35
                                                                                                                                                                                                  Chick; R35; uropathic; antiinflammatory; analgesic; gene therapy; seven transmembrane receptor; neuropathic pain; inflammation; incontinence; irritable bowel syndrome; RNA fingerprinting; PCR primer;

The invention relates to a method for predicting an individual's therapeutic response to the administration of interferon-alpha-2b and ribavirin for the treatment of a pathological condition, especially hepatitis C virus (HCW) infection. The method involves determining which allelic form is present at positions -3575, -2763, -1082, -819 and -592 of the interleukin-10 (IL-10) regulatory region, and comparing these with the allelic forms at these positions which are associated with a known cutcome of interferon-alpha-2b and ribavirin administration. Presence of the single mucleotide polyworphisms -592A, e197 as a haplotype, concompassing positions -3575, -2763, -1082, -081977 genoxypes, the combination of -592A, e197 as a genotype, or possession of the (108) TCATA haplotype (ancompassing positions -3575, -2763, -1082, -0819 and -592) is associated with a sustained response to interferon-alpha condition thereof primers to this therapy. In contrast, the presence of -592C and -819C, or the (108) TCATA haplotype indicates that the patient will be non-responsive to this therapy. The method optionally further comprises detection of the allele at position -318 of the cytotoxic T-lymphocyte antigen-4 (CTLA-4) promoter and the allele at position 49 of exon 1 of the CTLA-4 gene. The invention also encompasses kits and oligomucleotide primers for use in the methods of the invention. The method and primers care useful for identifying and analysing genetic polymorphisms in the IL-10 regulatory region and/or cyctocake T-lymphocyte antigen-4 (CTLA-4) promoter and the allele at position in pathological condition, or for predicting the outcome of therapputic intervention in pathological conditions such as bacterial infection), rheumatoid arrhitials systemic lupus erythematosus, 3jogren's syndrome, inflammatory bowel disease or multiple erythematosus. The present sequence is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18 BP; 7 A; 7 C; 4 G; 0 T; 0 U; 0 Other;

The invention relates to identifying an individual who has altered risk for developing coronary stenosis comprising detecting a single nucleotide polymorphism (SNP) in any one of the 67073 nucleotide sequences (not given in the specification), in the individual's nucleic acid acids, where the gresnece of the SNP is correlated with an altered risk for stenosis in the individual. Also included are an isolated nucleic acid molecule (comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP as cited above, or their complement), an isolated polypeptide comprising an amino acid sequence selected from any of the 569 amino acid sequences (not defined in the specification), an antibody that specifically binds to the polypeptide containing the SNP as cited (where the amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide is between about 16 and about 1,000 concleted caid molecule containing the SNP as the for detecting a variant polypeptide and identifying an agent useful concletion, detecting a variant polypeptide and identifying an agent useful contecting, detecting a variant polypeptide and identifying an agent useful contecting probe hybridisation, allele specific primer extension, allelesspecific amplification, sequencing, 5' nuclease digestion, and lead to sugariation, allele specific primer extension, allelessed signation, and and unidividual who has altered isk for developing coronary stenosis, and ultimately sudden cardiac death. The present sequence is an allele specific primer for amplifying a SNP containing region of a human marker gene associated with stenosis. NOTE: SEQ ID 1-67771 are not shown in the specification but are provided on a CD-R named CLOOISIOCDR which was not supplied with the specification.
                                                                                                                                                                                                                                                                                                                            Identifying an individual who has altered risk for developing stenosis comprises detecting single nucleotide polymorphism (SNP), in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 19; SEQ ID NO 68106; 146pp; English.

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.

Example 7; Page 490; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (MTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (HERA/C-erb2/neu), phospholamban (PLM), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleid end calcules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, disbetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocallular cardinoma. The anzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have Note: Some SEQ ID different sequences associated with them

nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepaticis can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a substrate/target sequence for a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ55889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66530 - ABZ66534, ABZ665310 - ABZ66534, ABZ66530 - ABZ66534, ABZ66530 - ABZ66534, ABZ665310 - ABZ66 The invention relates to a novel short interfering RNA (siRNA) nucleic 16.1%; Score 12.4; DB 1; Length 17; 71.4%; Pred. Homo sapiens. 18-DEC-2003 08-JAN-2003 ADC04446; ADC04446/c Gu Y; RESULT 74 \* 8 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describin in instation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO ö Gaps Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss. ö 16.1%; Score 12.4; DB 1; Length 17; 1; Indels Sequence 17 BP; 2 A; 4 C; 6 G; 5 T; 0 U; 0 Other; ftp.wipo.int/pub/published\_pct\_sequence Pred. The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELPI). The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELPI. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid ಹ New human sodium-hydrogen exchanger like protein 1 (NHBLP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human ss; gene therapy; vaccine; sodium/hydrogen exchanger like protein; NHELP1; passive replacement therapy; vaccine; diagnosis. The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELPI. The antibody or its antigen-binding fragment, and an antagoniet, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).
or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigon-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 numanated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant opphypaptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel isolated nucleic acid sequences involved

Novel enzymatic nucleic acids, ribozymes, which modulate expression of genes encoding vascular endothelial growth factor and/or VEGF receptor, useful for inhibiting tumor angiogenesis in cell, and for treating

Disclosure; SEQ ID NO 1056; 172pp; English.

cancer

The invention relates to enzymatic nucleic acids (I) i.e.

cribozymaes/Dixaymes/Chizaymes that target and modulate expression of, genes
encoding vascular endothablial growth factor (WEGP) and/or WEGP receptor
(WEGPRI and 2 encode by the Flt-1 and Kdr genes respectively). Also
(WEGPRI and 2 encode by the Flt-1 and Kdr genes respectively). Also
(T) to a call (by contacting the cell with the compound under conditions
(T) to a call (by contacting the cell with the compound and the other drug under conditions suitable for the
administration), administrating (I) to a mammal (by contacting the mammal
with the compound under conditions suitable for the
administration), administering (I) to a mammal (by contacting the mammal
with the compound under conditions suitable for the
administration), administering to subject, a nucleic acid molecule (II) that
with a subject having endometricals (by contacting the mammal
with a chemotherapeutic agent comprising contacting the mammal with the
compound and the Chemotherapeutic agent under conditions suitable for the
administration). (I) and administered to a mammalian cell, preferably
with a chemotherapeutic agent comprising contacting the mammal with the
compound and the Depending of the chemotherapeutic agent under conditions suitable for the
administration). (I) a administered to a mammalian cell, preferably
with a chemotherapeutic agent comprising contacting the mammal with the
compound and the presence of a delivery reagent which is a lipid such as
cationic lipid or phospholipid, or a liposome. The enzymatic nucleic acids are useful for
confour vegres gene, and is in a hammal and organe, DNAzyme, G-cleaver,
or Amberzyme configuration. The enzymatic nucleic acids are useful for
treating a subject having a condition associated with an increased level
cancer (such as renal cell catinopathy, in a subject. They are also useful for
treating a subject having a condition associated with an increased level
cancer (such as renal cell catinopathy, proceeding a subject preferably paracti

antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel methylation state information about CpG islands in the promoter region of a gene associated with primary liver cancer, its use and a reagent kit for detecting primary liver cancer. The reagent kit contains a methylation-specific restriction endonucless and the promoter CpG island-specific primer pairs of a gene associated with liver cancer, a reagent for transforming the methylation cytosine to uracil and primers for the promoter CpG island of the gene associated with liver cancer. The present sequence is that of a PCR primer which was for amplification of a region of a human liver cancer-associated gene promoter during the analysis of methylation state in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human liver cancer-associated gene promoter-related PCR primer SeqID107.

cancer,

expression. (I) is useful for treating cancer, such as pancreatic

```
The invention relates to a double-stranded short interfering RNA (siRNA) molecule (I) comprising a first nucleotide sequence having 19-23 nucleotides complementary to an RNA sequence encoding HERZ or its portion, and a second nucleotide sequence having 19-23 nucleotides exhibiting complementarity to the first sequence, and including at least one nucleotide that is not a 2'-OH containing ribonucleotide. Also described is a method of producing a class of nucleic acid-based gene modulating agents that exhibit a high degree of specificity for RNA of a desired target. (I) is useful for modulating HERZ activity in a cell, and for treating diseases or conditions related to levels of HERZ gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel double-stranded short interfering RNA molecule having first nucleotide sequence complementary to RNA encoding HBR2 or its portion, and second nucleotide sequence having complementarity to first sequence,
                                                                                                                                                                                                                                                                                                                                                     short interfering RNA; siRNA; RNA interference; gene silencing;
                                                                                                                                                                                                                                                                                   Human HER2 substrate RNA sequence SEQ ID NO:5441.

AAA16775 to AAA1167 and AAA1762 to AAA17622 represent ribozyme sequences for ARNT, corresponding target sequences; AAA17623 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA19223 to AAA19223 to AAA21925 to AAA19251 to AAA1925 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21868 to AAA21868 to AAA23253 to AAA23256 to AAA23325 to AAA23342 represent ribozyme sequences for integrin subunit beta 3, and AAA23476 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23342 represent ribozyme sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                bladder cancer, lung cancer, breast cancer or prostrate cancer. The present sequence represents a human HRR2 substrate RNA sequence for a DNAzyme (ribozyme), which is used in an example from the present invention for the identification of potential target sites in human HER2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antifilammatory; antiatrathritic; antiposriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; porianis; vertuca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.

AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit betaa, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, veruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Oslar-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit beta-3

molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (FFB-1B), methionine minopeptidase (MetAP-2), human telomerase (hTERT), protein kinase C alpha (FKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (ps-2), and hepatitis by virus (HWV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HM), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatitis B infections, and hepatitis and hepatitis and seases. Alzheimer carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present calls and to detect the presence of specific RNA in a cell. The present examples of the present invention. Note: Some SBQ ID Nos are repeated more than once in the specification, but these have different sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; MetAP-2; human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACB; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; halrpin; NCH; inoxyme; G-cleaver; amberzyme; zinzyme; cancer; beast cancer; Alzheimer's disease; diabetes; obesity; cardiac disease; heart disease; agg-related disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;
                                     Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                  The present invention relates to the use of enzymatic nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (FTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (MTBRT), protein kinase C alpha (FKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), protein kinase C presentiin-2 (ps-2), and hepatitis B virus (HBN) proteins. The enzymatic nucled nammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, c include nammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, c for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as sell agiagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present encorred in the presence of sequence for a riboxyme used in the presence of sequence a riboxyme used in the control of the actions which the present the presence of sequence for a riboxyme used in the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ID Nos are repeated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the examples of the present invention. Note: Some SEQ ID Nos are repeate more than once in the specification, but these have different sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes obesity and heart disease.
                                                                                                                                                                                                                                                                                                                                                                                   Burgin A;

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes obesity and heart disease.

Example 4; Page 366; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERA/C-erb2/neu), phospholamban (PLM), presentin-1 (ps-1), presentin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (incyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Albriemer's disease, diabetes, obesity, cardiac diseases e.g. heart disease, agg-related diseases, hepatitis B infections, and hepatitis and hepatocellular cardimomar. The enzymatic nucleic acid molecules can also be used as setting and to detect the presence of specific RNA in a cell. The present cancer in particular breast engine arriboryme used in the content of the presence of specific RNA in a cell. The present cancer in the present cancer in a ribozyme used in the present cancer in t E the present invention. WPI; 2001-244406/25.

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes. obesity and heart disease.

Example 4; Page 391; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBR), protein kinase C alpha (FRC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presentiln-1 (ps-1), presentiln-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HB), hairpin, NCT (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful

for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepaticis and becocellular cardinomar. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a substrate/target sequence for a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them. 888888888888888

Mcswiggen JA; Blatt L,

WPI; 2002-706994/76.

New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

Claim 23; SEQ ID NO 5925; 495pp; English.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (RNV). The nucleic acid molecules are useful for treating a condition related to WVV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least that 2-O-methyl moddifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating presst; lung, prostate, colorectal, brain, oseophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or untiliding resistent cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rheumatoid arthritis; restenceis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; seppis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss.

MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 1p21.1, and MD21 is encoded at chromosome 1p21.2 is encoded at chromosome 1p22.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder or in manufacturing a medicament for treating or preventing a disorder or in MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The
cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoria arthritis, restencisis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocarchial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ4; MDZ4; MDZ1; hDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
